General Astronomy/Daily Motions

the constellations move, seeming to circle about the pole. Because the daily motion of the stars is driven by the same mechanism that drives the motion

Every day, the Earth turns once on its axis. At the Earth's equator, we move around the center of the Earth with speeds near a thousand kilometers per hour because of this rotation. We feel nothing, but we can see the effect of Earth's rotation. An observer on Earth sees everything in the sky appear to rotate around Earth at the rate of once per day. This motion is not apparent to an observer who steps outside for a moment, since it is so slow. For the motion to become apparent, an observer must watch the sky for a period of hours. During the day, the motion manifests itself in the movement of the Sun, which proceeds from the East in the morning towards the west in the evening. At night, the constellations move, seeming to circle about the pole.

Because the daily motion of the stars is driven...

=== sync ===

sync write memory buffers to disk

Example:

Sync has no options, doesn't display any messages

$ sync

Tips:

It is always good to type sync a couple of times, one the important functions of sync is to update your superblock information.
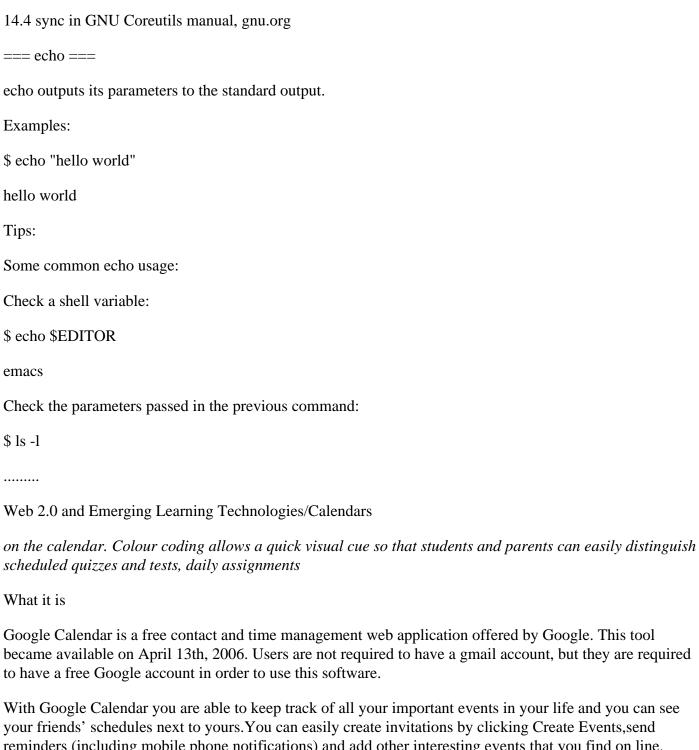

The sync calls sync Unix system call and exits with success code '0' or '1' if it fails. These exit codes stored in $? variable.

$ sync

$ echo $?

0

The above example shows that sync was successful.

== Introduction ==

PHProjekt is a web-based groupware and project management suite available at no charge under the GNU General Public License at www.phprojekt.com.

=== Keeping up with development ===

At present, PHProjekt has reached version 4.2.3, while the manual is at version 4.1. PHProjekt is distributed with a number of help files, but these are also out of date.

You can file bug reports/wishes to the Bugtracker on the home page, or try your luck in the Forum. This WikiBook is a user manual for PHProjekt, written by the end-users themselves. It is our hope to keep up with development by using this wiki.

=== Feel free to contribute ===

== The Celestial Sphere ==

If you look out from an empty field into a dark sky, you will get the impression that you are standing on a flat plate, enclosed by a giant dome. Depth perception fails us for the distant objects we see in the sky. This creates the appearance that all of the stars have the same distance.

The stars appear to move together across the sky during the night, rising in the east and setting in the west, as if they are affixed to the inside of a dome. Because of this, many ancient civilizations believed that a dome really did enclose the Earth. Only a few centuries ago astronomers came to realize that the stars are actually very far away, scattered throughout the Milky Way Galaxy, rather than attached to the inside of a vast sphere.

The old idea remains useful, however. The...

== Introduction ==

Studies have shown that daily self-monitoring can promote healthy lifestyles and weight loss over an extended period of time. While the act of recording daily activity is in itself beneficial, using mobile applications to monitor fitness makes it easier for people to change their lifestyle habits and adhere to their fitness goals. However, many of these studies also rely on extensive coaching, incentives, and feedback to promote behavioral changes.

With the advent of numerous fitness applications available for mobile devices, people are able to collect quantitative data on their day-to-day activity patterns and behaviors. Applications like Fitbit connect a biometric wearable to a mobile device to keep track of daily step count, distance walked, calories burned, and sleep...
