

Steaming!

Steaming

"steaming". In Thailand steaming is the definition of minimalist cooking. Wheat foods are steamed as well. Examples include buns and Chinese steamed cakes

Steaming is a method of cooking using steam. This is often done with a food steamer, a kitchen appliance made specifically to cook food with steam, but food can also be steamed in a wok. In the American Southwest, steam pits used for cooking have been found dating back about 5,000 years. Steaming is considered a healthy cooking technique that can be used for many kinds of foods.

Compared to full immersion in boiling water, steaming can be faster and more energy-efficient because it requires less water and takes advantage of the excellent thermodynamic heat transfer properties of steam.

Steaming (disambiguation)

with steam *Vaginal steaming, a controversial alternative health treatment* *Steaming (film), a 1985 film directed by Joseph Losey* *Steaming (play), a 1981 play*

Steaming is a form of cooking that uses steam as the main heating method.

Steaming may also refer to:

Soil steam sterilization

Hay steaming, a method of treating hay to remove airborne dust

Steam bending, a method of bending wood with steam

Vaginal steaming, a controversial alternative health treatment

Steaming (film), a 1985 film directed by Joseph Losey

Steaming (play), a 1981 play by Nell Dunn

Steaming (crime), robbery on a train or bus, usually perpetrated by a gang, often violent

Slow steaming, operating ships at low speeds to save fuel

A song appearing on Sarah McLachlan's 1988 debut album Touch

using a steam engine, particularly operating a ship powered by steam

Vaginal steaming

Vaginal steaming, sometimes shortened to V-steaming and also known as wormwood steaming, is an alternative health treatment wherein a woman squats or

Vaginal steaming, sometimes shortened to V-steaming and also known as wormwood steaming, is an alternative health treatment wherein a woman squats or sits over steaming water containing herbs such as mugwort, rosemary, wormwood, and basil. It has been practiced in Africa (Mozambique, South Africa), Asia (Indonesia, Thailand), and Central America (among the Q'eqchi' people).

Vaginal steaming is described in spas as an ancient Chinese treatment for reproductive organ ailments and is claimed to have other benefits. No empirical evidence supports any of these claims. It has become a fad for women in the Western world.

There is no evidence that vaginal steaming has any benefits, while there is evidence that it can be dangerous.

Steam (service)

Steam is a digital distribution service and storefront developed by Valve. It was launched as a software client in September 2003 to provide video game

Steam is a digital distribution service and storefront developed by Valve. It was launched as a software client in September 2003 to provide video game updates automatically for Valve's games and expanded to distributing third-party titles in late 2005. Steam offers various features, such as game server matchmaking with Valve Anti-Cheat (VAC) measures, social networking, and game streaming services. The Steam client functions include update maintenance, cloud storage, and community features such as direct messaging, an in-game overlay, discussion forums, and a virtual collectable marketplace. The storefront also offers productivity software, game soundtracks, videos, and sells hardware made by Valve, such as the Valve Index and the Steam Deck.

Steamworks, an application programming interface (API) released in 2008, is used by developers to integrate Steam's functions, including digital rights management (DRM), into their products. Several game publishers began distributing their products on Steam that year. Initially developed for Windows, Steam was ported to macOS and Linux in 2010 and 2013 respectively, while a mobile version of Steam for interacting with the service's online features was released on iOS and Android in 2012.

The service is the largest digital distribution platform for PC games, with an estimated 75% of the market share in 2013 according to IHS Screen Digest. By 2017, game purchases through Steam totaled about US\$4.3 billion, or at least 18% of global PC game sales according to Steam Spy. By 2021, the service had over 34,000 games with over 132 million monthly active users. Steam's success has led to the development of the Steam Machine gaming PCs in 2015, including the SteamOS Linux distribution and Steam Controller; Steam Link devices for local game streaming; and in 2022, the handheld Steam Deck tailored for running Steam games.

Steam

Carlo; Seel, Wendy E. (1 November 2003). "Low Temperature–Short Duration Steaming of Soil Kills Soil-Borne Pathogens, Nematode Pests and Weeds". European

Steam is water vapor, often mixed with air or an aerosol of liquid water droplets. This may occur due to evaporation or due to boiling, where heat is applied until water reaches the enthalpy of vaporization. Saturated or superheated steam is invisible; however, wet steam, a visible mist or aerosol of water droplets, is often referred to as "steam".

When liquid water becomes steam, it increases in volume by 1,700 times at standard temperature and pressure; this change in volume can be converted into mechanical work by steam engines such as reciprocating piston type engines and steam turbines, which are a sub-group of steam engines. Piston type steam engines played a central role in the Industrial Revolution and Steam-based generation produces 80 percent of the world's electricity. If liquid water comes in contact with a very hot surface or depressurizes quickly below its vapour pressure, it can create a steam explosion.

Steaming (film)

"Steaming (1985)". BBFC. Retrieved 22 October 2021. Caute, David (1994). Joseph Losey. Oxford University Press. p. 460. "Festival de Cannes: Steaming";

Steaming is a British drama film directed by Joseph Losey, released in 1985, the year after his death. The last film that Losey directed, it was adapted by Nell Dunn and Patricia Losey from Dunn's play of the same name. The film was screened out of competition at the 1985 Cannes Film Festival. The story is about the women who meet regularly in a Russian-style Steam bath and decide to fight its closure. The cast was headed by Vanessa Redgrave, Sarah Miles and Diana Dors. It was the last film appearance by Dors, who died in 1984.

The film has no overall plot and is a series of conversations between the women involved. The unifying issue is the announcement that the baths are to be closed to build a leisure centre.

Steam engine

A steam engine is a heat engine that performs mechanical work using steam as its working fluid. The steam engine uses the force produced by steam pressure

A steam engine is a heat engine that performs mechanical work using steam as its working fluid. The steam engine uses the force produced by steam pressure to push a piston back and forth inside a cylinder. This pushing force can be transformed by a connecting rod and crank into rotational force for work. The term "steam engine" is most commonly applied to reciprocating engines as just described, although some authorities have also referred to the steam turbine and devices such as Hero's aeolipile as "steam engines". The essential feature of steam engines is that they are external combustion engines, where the working fluid is separated from the combustion products. The ideal thermodynamic cycle used to analyze this process is called the Rankine cycle. In general usage, the term steam engine can refer to either complete steam plants (including boilers etc.), such as railway steam locomotives and portable engines, or may refer to the piston or turbine machinery alone, as in the beam engine and stationary steam engine.

Steam-driven devices such as the aeolipile were known in the first century AD, and there were a few other uses recorded in the 16th century. In 1606 Jerónimo de Ayanz y Beaumont patented his invention of the first steam-powered water pump for draining mines. Thomas Savery is considered the inventor of the first commercially used steam powered device, a steam pump that used steam pressure operating directly on the water. The first commercially successful engine that could transmit continuous power to a machine was developed in 1712 by Thomas Newcomen. In 1764, James Watt made a critical improvement by removing spent steam to a separate vessel for condensation, greatly improving the amount of work obtained per unit of fuel consumed. By the 19th century, stationary steam engines powered the factories of the Industrial Revolution. Steam engines replaced sails for ships on paddle steamers, and steam locomotives operated on the railways.

Reciprocating piston type steam engines were the dominant source of power until the early 20th century. The efficiency of stationary steam engine increased dramatically until about 1922. The highest Rankine Cycle Efficiency of 91% and combined thermal efficiency of 31% was demonstrated and published in 1921 and 1928. Advances in the design of electric motors and internal combustion engines resulted in the gradual replacement of steam engines in commercial usage. Steam turbines replaced reciprocating engines in power generation, due to lower cost, higher operating speed, and higher efficiency. Note that small scale steam turbines are much less efficient than large ones.

As of 2023, large reciprocating piston steam engines are still being manufactured in Germany.

Soil steam sterilization

types of such steam application are also available in practice, including substrate steaming, surface steaming, and deep soil steaming. Several methods

Soil steam sterilization (soil steaming) is a farming technique that sterilizes or partially sterilizes soil with steam in open fields or greenhouses. Steaming leads to a better starting position, quicker growth and strengthened resistance against plant disease and pests. In recent years soil steaming has regained popularity. It is now considered the best and most effective way to disinfect sick soil, potting soil, and compost.

Steam effectively kills weeds, bacteria, fungi and viruses by heating the soil to levels that cause enzyme inactivation or the unfolding and coagulation of vital cellular proteins. Soil steaming is considered a good alternative to bromomethane, whose production and use was curtailed by the Montreal Protocol. Biologically, soil steaming is considered a partial disinfection, since heat-resistant spore-forming bacteria can survive the process and revitalize the soil after cooling.

Soil steaming is also effective for addressing soil fatigue, which is the degradation of soil health and fertility arising from improper agricultural management practices. Steaming the soil has been shown to effectively release nutritive substances blocked within fatigued soil.

In the laboratory, soil steam sterilization via autoclave is an important step in agricultural research, specifically into regenerative agriculture, permaculture, and some ex situ cryopreservation. This process achieves true sterilization, completely disinfecting the soil rendering all microorganisms, spores, viruses, fungi, and pathogens entirely inactive.

Double steaming

Double steaming, sometimes called double boiling, is a Chinese cooking technique to prepare delicate food such as bird's nest soup and shark fin soup.

Double steaming, sometimes called double boiling, is a Chinese cooking technique to prepare delicate food such as bird's nest soup and shark fin soup. The food is covered with water and put in a covered ceramic jar and the jar is then steamed for several hours. This technique ensures there is no loss of liquid or moisture (its essences) from the food being cooked, hence it is often used with expensive ingredients like Chinese herbal medicines.

In Cantonese, double steaming is called dun (simplified Chinese: 炖; traditional Chinese: 燉; pinyin: dùn). The meaning of the Chinese character for dun in Cantonese is different from that in Mandarin, because dun means to simmer or stew in Mandarin. This technique is also common in Fujian, a neighbouring province of Guangdong (Canton).

In ancient China, the double steaming method was based on the Chinese philosophy of maintaining health through diet dates as far back as the 6th century BC, when the founder of Taoism, Lao Tzu, famously said, “medicine and food are from the same source”. It was mostly used on the emperor's meal during the fall and winter of the year, when most people are more easily getting sick. The significant difference between its and other meals is that it can cooked expensive food and Precious medicinal materials into one meal. It was served to the emperor for nourishment purpose and continued in modern time.

This technique is said to achieve the maximum extraction of flavour with little compromise to the flavour or texture of the ingredients used. It is therefore the method of choice for coaxing forth the delicate flavour. Full flavour extraction can take up to 5 hours.
