HepaRG cell line is a human hepatic in vitro line used in liver biology research and for assessing liver pathology, hepatotoxicity, and drug-induced injury. The HepaRG model is considered a surrogate for Primary Human Hepatocytes, which are the most pertinent model to reproduce the human liver functioning as they express 99% of the same genes.

In contrast to the historic hepatic line HepG2, HepaRG cells preserved various liver-specific functions, including the expression of CYP enzymes and transporters, the formation of bile canaliculi, and, the ability to be applied in 2D and 3D configuration.

Near-infrared window in biological tissue

Eschenbach. Univ. of Texas M. D. Anderson Cancer Center, 1987. R. P. de Souza Bachour, C. T. Dominguez, and G. C. Cardoso, 2023, Optical attenuation coefficient

The near-infrared (NIR) window (also known as optical window or therapeutic window) defines the range of wavelengths from 650 to 1350 nanometre (nm) where light has its maximum depth of penetration in tissue. Within the NIR window, scattering is the most dominant light-tissue interaction, and therefore the propagating light becomes diffused rapidly. Since scattering increases the distance travelled by photons within tissue, the probability of photon absorption also increases. Because scattering has weak dependence on wavelength, the NIR window is primarily limited by the light absorption of blood at short wavelengths and water at long wavelengths. The technique using this window is called NIRS. Medical imaging techniques such as fluorescence image-guided surgery often make use of the NIR window...

Jammed finger

Jammed finger is a common term used to describe various types of finger joint injuries. It happens from a forceful impact originating at the tip of the finger directed towards the base. This type of directional force is called axial loading. It occurs most often when the finger is fully extended. This kind of impact can stretch or strain the ligaments in the joint beyond their normal limits. The severity of damage to the finger increases with the amount of force on the fingertip. In severe cases, injury to bone may occur. When experiencing a jammed finger, the extent of injury is not always obvious and one should be evaluated by a medical professional. Toes may become jammed as well, with similar results.
